

## Key Features:

- Simultaneous Playback
- EPoS Text Overlays on Camera View
- Object Search
- Bookmark Function
- Motion Detection & Recording
- EPoS Search (Cancel Sales, No Sales etc.)
- Various Events Alerts
- Electronic Mapping Layout
- Emergency Recording
- Immediate Password Lock
- Local and Remote Video Viewing Protection
- Two-way Audio Communication

### Text Overlays on Camera View

iPoS is revolutionary to the CCTV industry, with the ability to capture transaction data from any Point of Sale equipment, overlaying it on live and playback camera views. Transaction data can be searched for using POS query program by the terms of date/time/transaction type, with preview transaction video display.

### Simultaneous Playback

You have the ability to playback recent footage from any video channel immediately with the one button-click whilst on live surveillance.

### Object Search

The operator has the ability to record any movement from a highlighted object, which can then be searched over a selected time and date to show any movements made within this highlighted area.

### Bookmark Function

Users can add important scenes to a bookmark list with channel/date/time information, and can search for them easily at a later date.

### Various Events Alerts

If one of your sites is being broken into, you can set the software to send you an e-mail, make a sound to alert you, or even have a screen pop up to warn you of the situation. This can be done for motion detection, sensor detection and video loss.

## Electronic Mapping Layout

E-mapping is the more efficient way to keep an eye on your business. Locations of cameras, sensors and alarms are displayed on an on-screen drawing of your facility so that users can check the situation of the site at a glance.

## Local and Remote Video Viewing Protection

Specific live and remote channels can be hidden to specific users for security reasons, giving you greater control over what can and what cannot be seen.

## Two-way Audio Communication

Immediate two-way conversation through the internet can be done between DVR server and a remote client using headsets installed to each PC. This can also be used as a defensive measure to warn off intruders through the audio output channel.

## Emergency Recording

Users can apply more intensive frames to the pre-defined channels by one button-click for recording important scenes instantly.

## Digital Zoom

Part of a picture can be zoomed in on to enlarge the picture, which can then be exported to still image or printed.

## PDA Client

You can keep an eye on your business wherever you are using a PDA Client. Users can monitor the DVR system at any site using a PDA client via a wireless data transfer.

## Event Search

Users can search the video footages by motion or sensor detection with preview replay in the separated menu.

## Immediate Password Lock

Whilst the operator is absent, all functions on live mode can be locked with a one button-click, to prevent unauthorised personnel operating the system.

## Multi-Site Viewer

There is a maximum of 36 screen divisions on any one playback screen, but the system can monitor up to 72 channels simultaneously by moving over two pages.
