Quantum point of sale

We come to the table with over forty years of experience in providing EPOS systems to the hospitality trade.

Quantum is modern with an easy-to-use interface and is built on the latest technology. It's fast, responsive and is easily customised to suit your business.

Our Quantum POS software is rich with features that are all designed to make life easier and more productive for your staff. We are one of the largest suppliers of EPOS systems to SME businesses in the UK, with over one hundred POS licences sold each month and we are regarded as one of the market leaders in the industry. With our network of offices throughout the UK and our dedicated technical support desk, you can be assured that in Quantum you have chosen a reliable partner.

Staff Training

Quantum POS is perfect for multiple operators who expect the highest of standards for their customers. The till can be used as a central location to access and view critical business information, such as health and safety policies, company handbooks and training videos. Product ingredient content can also be displayed on the POS along with a picture of the finished item, showing staff what is expected, helping to maintain the very highest of standards.

Cash Declaration

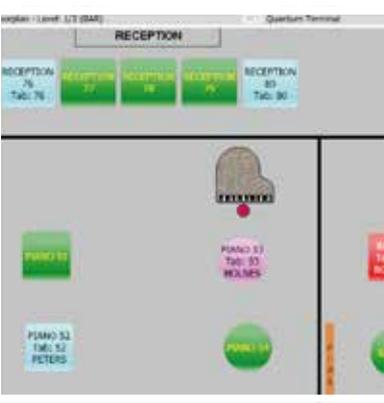

As part of the cashing up process, the person responsible has to count the money in the drawer and tell the till exactly how much there is before an end of day report (Z Reading) can be run. Quantum POS will then identify and declare any differences. This prevents one of the most common forms of fraud, when staff don't register certain sales into the till and then pocket the difference between the 'Z' Reading at the end of the day.

Table Management

The tables on the floor plan can be configured to show their current status using their current status using user-defined colour codes. In the most basic form this may simply show whether the table is occupied or not, however this can be expanded to show every stage of the meal, including information such as whether the customer has received their bill – information which can help your staff to determine when additional covers are going to become available.

Stock Control

Quantum POS has the ability when paired with the back office to provide market leading real-time stock control. Not only can you monitor GPs easily, all of the Stock functionality that you would traditionally expect to be available only on the back office system is available on the Till itself in order to save you time and money. Raising an order, taking a supplier delivery, recording waste, and even conducting either a line check or full stock take, are all features that can be done on the POS itself.

Staff Identification

We appreciate that it's important to know which member of staff was responsible for which sale. Not only does this help to eliminate theft, but also can help to identify which members of staff are making mistakes and might require additional training or to highlight those who are excelling in their sales and service and should be rewarded.

Methods available for staff to sign on to the till include everything from simple PIN number access codes, magnetic swipe cards, iButtons, fingerprint identification units through to RFID contactless cards.

Stock Count Down

Quantum POS features the ability to see on screen what stock you have of certain products, and even restricts their sale if they fall below zero. This is useful for daily food specials where only a certain number might be available, and means that their availability can be managed at the point of sale, rather than further down the line when the order has already found its way to the kitchen.

Handheld Option

Available for multiple operating systems such as Apple IOS, Windows, and Android, with Quantum you have an EPOS system capable of working on the move. Taking orders directly at the table means no more illegible hand written orders being incorrectly entered onto the till.

Quantum POS transmits the order directly to the terminal and the relevant dispense printers or displays in the bar / kitchen. In the event of the customer asking for something that's not on the menu, custom messages can even be keyed in by hand using the on screen interactive keyboard, saving multiple trips to the kitchen and increasing staff productivity.

Stand-Alone or Linked

If required Quantum can run on its own without the need for a server, connection to the internet, or back office PC, making it suitable for the small independent operator, remote locations, and where all important space is an issue.

Quantum POS will also continue to work in the event of a network or machine failure. Each till is independent, meaning that unlike some of the more older dated systems on the market, if one machine or 'the Master' fails the others will continue to work, and most importantly no bills or table information will be lost.

Promotional Features

Optional customer advertising screens can allow you to publicise upcoming events or promotions whilst at the same time displaying vital sales information that would traditionally have been shown on a small customer display.

The customer can clearly see that the staff are registering the sale correctly along with item prices, a total sale value and the amount of change owed – all whilst being captivated by your visual marketing!

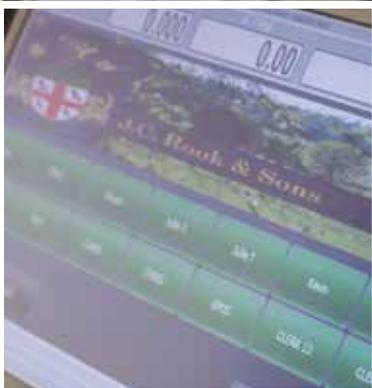

Quantum POS features the ability to define multiple price levels for happy hours, events or functions. Multi-buy offers and complex food and drinks deals can be programmed and set up to be activated automatically by time and day or kept under full manual control. The ability of the system to track sales to individual staff members means that incentives can be offered for the sale of promotional items as a method of increasing GP.

Product Information

Quantum knows all about the products you are selling, from a detailed ingredient list to allergen information, cooking instructions, or even pictures showing serving suggestions.

The product information function allows your staff to view any of this information and even print out a summary sheet for enquiring customers. Great for ensuring a consistent message or presentation over a large number of outlets.

No	Name	Order Cost	Order Qty	Unit Cost	Opening Stock
Dept 4 - FRESH					
4001	SHRIMP ORIGINAL	47.00	100	0.38	1000

4015	MILK CARAMEL	12.00	12	1.00	0

Hotel PMS Interface

The Quantum POS hotel property management system interface enables guests staying within your hotel to charge their purchases at the bar or restaurant to your existing hotel management system so that they can be paid for at the end of their stay when they check out. Please contact us to obtain a full list of the PMS systems available which are compatible with Quantum POS .

Prompting & Up-Selling

When processing an order Quantum POS automatically prompts the user for cooking choices and food options. It also encourages the staff to upsell by reminding them to ask the customer if they would like additional chargeable products, such as side orders.

This simple but essential process means the kitchen staff always get the complete order at the first time of asking, saving time and enhancing quality of service.

Full Product Images

Quantum POS has the ability to display a full range of product images on both the till itself and on the optional rear display. This feature is useful for helping customers who may be hearing-impaired or where English is not their first language and is just another aspect of how Quantum can help you provide a high standard of care to your customers whilst minimising mistakes.

Chip & Pin

As an accredited partner of Verifone – the market leader in the provision of card payment solutions – Quantum offers the very best in chip & pin solutions with seamless integration between the credit card and EPOS systems.
